

New Line Quick Add — API Documentation

Create a new line (connection) request quickly with just the customer's **name** and **mobile number**.

Endpoint

Method	POST
URL	https://billing.circlenetworkbd.net/api/new-line-req-quick-add
Auth	None (public endpoint)
Content-Type	application/x-www-form-urlencoded or application/json

Request Parameters

Field	Type	Required	Rule	Description
name	string	Yes	required	Customer full name
phone	string	Yes	exactly 11 digits	Customer mobile number (e.g. 01712345678)

Notes

- Only `name` and `phone` are accepted. The request **source** is assigned automatically — you do **not** send it.
- `phone` must be **exactly 11 digits** (numbers only — no `+`, spaces, or dashes).

Example Request

cURL

```
curl -X POST "https://billing.circlenetworkbd.net/api/new-line-req-quick-add" \
  -H "Accept: application/json" \
  -d "name=Rahim Uddin" \
  -d "phone=01712345678"
```

JSON body

```
POST /api/new-line-req-quick-add HTTP/1.1
Host: billing.circlenetworkbd.net
Content-Type: application/json
Accept: application/json

{
  "name": "Rahim Uddin",
```

```
"phone": "01712345678"
}
```

Responses

All responses return HTTP `200` with a JSON body containing an `error` flag. **Always check the `error` field**, not the HTTP status.

Success

```
{
  "error": false,
  "message": "Data saved successfully"
}
```

The `message` text is configurable on the server, so it may differ.

Validation error (missing / invalid fields)

```
{
  "error": true,
  "message": {
    "name": ["The name field is required."],
    "phone": ["The phone must be 11 digits."]
  }
}
```

Duplicate request (same number within 24 hours)

```
{
  "error": true,
  "message": {
    "already_exist": "Your are already applied for new line. Please try after 24 hour."
  }
}
```

Business Rules

1. **Duplicate protection:** The same `phone` number can submit only **once per day**. A second request with the same number on the same calendar day is rejected with the `already_exist` message.
2. **Source:** Every request created through this endpoint is tagged with a fixed internal source.
3. **Status:** The request is created with an internal status of *quick request* and then processed by the operations team inside the panel.

Quick Integration Checklist

- Send a `POST` request to `/api/new-line-req-quick-add` .
- Include `name` and `phone` (11 digits).
- Read the JSON response and check `error` :
 - `error: false` → success, show the `message` .
 - `error: true` → show the validation / duplicate `message` .
- Do not resend the same number within 24 hours.
